Survey (USGS).

Summary

Due to the climate change and synoptic situations changes, rainfall situation has been changed.

However the Eastern and Southeastern regions of the country received good rainfall due to Indian Monsoon activities but still Comparison of rainfall data for the month of September 2012 with the same month in 2011 shows a decrease of rainfall during the month of September 2012 over the same month of last year all over the country.

In most parts of the country temperature had no significant change during the month of September 2012 over the same month in , but lowlands particularly the Southwestern region had experienced higher temperature comparison to the same month of last year.

Wheat has been harvested almost all over the country, and some of the provinces preparation of plant and sowing of wheat seed is in progress.

Crop Stage, Crop Condition and Adverse Factor

Zone	Province	District	Station	Wheat		
				Crop Stage	Crop Condition	Adverse Factor
Central	Kabul	Shakardara	Karizmir	Ploughing & Planting		
		Paghman	Paghman			
		Kabul	Darulaman			
		Surubi	Surubi	Harvested

Wheat Crop Stage, Condition and Adverse Factor Maps

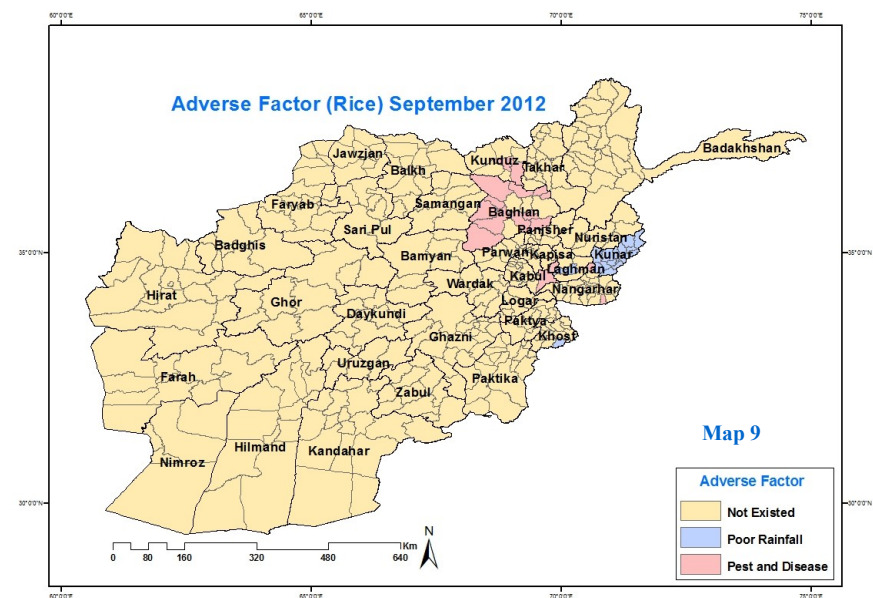

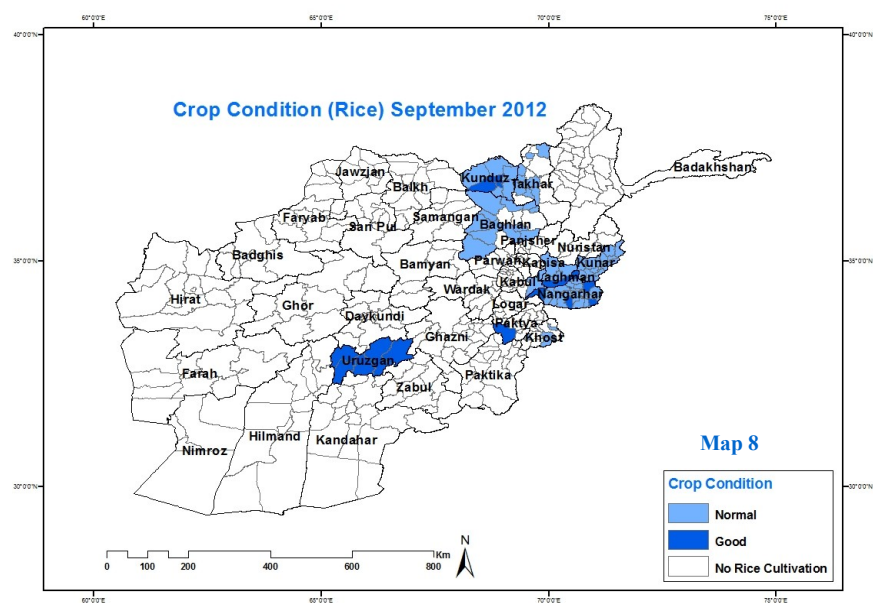

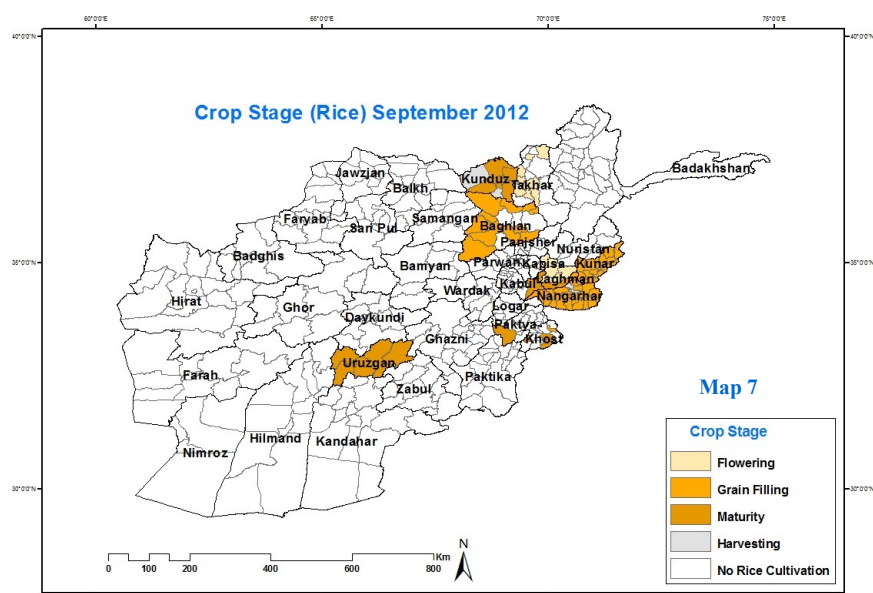

Data Source: Agromet Network

As it is obvious to all, RAINFALL, plays a vital role in the development and distribution of plant life, but the variability and extremes of rainfall can lead to soil erosion and land degradation.

Rainfall events can make land more vulnerable to degradation namely, these degradations become more acute when the prospect of climate change is introduced. And as it is clear to all who are involving in the process of its studying, rainfall and temperature are the most important factors in determining the phonological process of plant growth stages and also the distribution of vegetation types on the other hand, there is a strong correlation between rainfall and biomass.

since water is one of primary inputs to photosynthesis. It is worth mentioning that climatologists use an aridity index, the ratio of annual precipitation to potential evaporation to help classify desert (arid) or semi-arid areas ($P/E > 1$) is an index of aridity. The extremes of either too much or too little rainfall can produce soil erosion that can lead to land degradation. However soil scientists consider rainfall the most important factor governing soil erosion caused by forces of raindrops. The greater the intensity of rainfall and subsequent surface runoff, the greater the soil particles that are carried away.

A critical factor that determines soil erosion by rainfall is the permeability of the soil. Which indirectly influence the total amount of soil loss and the pattern of erosion on slopes. One unfortunate by product of runoff is the corresponding chemical material to transfer into the ground water. According to the following table all the process is clear, because some places are seen to be wetted and no drought is governed.

All the tabulated places are distributed into three categories, for example those stations with no changes and zero observation, like below. Kunduz – Aibak – Mazar – Saripul – Uruzgan – Zaranj – Hirat – Qala-e-naw – shindand. And one can say that the line of (Zero-Isotherm) passing above the thermal map of the mentioned provinces and also in this way, those places have the same thermal peculiarities from the view point of meso-climate and if it be so, the same phonological process of thermal applications can be carried out.

That is because in the same season all the cultivated crops have the same procedure of growing degree days, so from all respects, like drought, aridity index, and vegetative index and so on the mentioned provinces are lying on the same line of isothermal. now we consider the provinces with having the moderate and low degree of temperature like below places.

Fayzabad – Baghlan – Dara-e-soof and bamyan. In which having the changes in a small scale of growing degree days, it also means the mentioned places were affected by unstable weather masses or frontal attack. And there could be predicted a calm and stable weather conditions.

More over in the same way there are some another regions with having the higher temperature degrees like places. Jaghatoo, Paghman, Sarobi, Asmar, Ghazni, Jalalabad, Mehterlam, Paroon, Gardiz, Ghazni, Khost, Urgan. Those regions having the higher degrees of temperatures, that is ofcourse there are some motivations in rising the temperature of them, the most of all are the convective developed local cloud which forms the cumuliform cloud products precipitations, it is meaning that monsoon stream lines which spring from the Indian ocean can cover through these regions. It is actually worth mentioning that, monsoon- streamline has its effectiveness over the mentioned regions, it is meaning that apart from local convective precipitations, there is some flowing masses from the side of south and south-west of Afghanistan and sweep the mention regions, in which causes rainfall to those provinces. According to the table there are some regions with not having any changing in the process of rainfall variations it is meaning that the mentioned places are under the attack of drought, as it is obvious, average temperature is in the mood of ascending, and could be predicted for periodic drought in the future so data indexes indicating some regions with aridity by the value of zero rainfall like, Hirat – Qala-e-naw – Zaranj – Shindand- Uruzgan – Saripul – Mazar-e- sharif – Kunduz and some another.

Since the mentioned provinces look different in view of their geographical specifications like latitude, longitude and altitude, but due to their some orographic and geographic locations or some another climatic factors different from each other, for example some regions are very suitable for creating of convective rainfall and creation of some another meteorological phenomena for instant, Paroon is different in its weather conditions with respect to the others, that is because, this place indicating high rainfall at the level of the country.

Effective Rainfall: & Snowfall.

Precipitation

Station Name	September of (2012)			Deviation	Comparison	Table 3 Prediction
	2011	2012	LTA			
bamyan	1	1	4.1	3.1	Under normal	Probable Drought
Kabul	14.8	3.4	0.2	-3.2	Over normal	Probable Drought
Logar	20	9	0.4	-8.6	Close to normal	Periodic Drought

Sarobi	14.5	24	8.8	-15.2	Over normal	Wettest
Asmar	64	47	27.7	-19.3	Over normal	Drought is seen..
Ghazi abad	28	69	8.6	-60.4	Over normal	No change .
Jalalabad	28	26	9.4	-16.6	Over normal	No change Is seen.
Mehterlam	25	86.8	11.3	-75.5	Over normal	Not significant Change.
Paroon	180	74	41	-33	Over normal	No Drought
Baghlan	0	0	0.2	0.2	Under normal.	No change Is seen.
.faizabad	4	0	2.2	2.2	Close to Normal.	Not significant Change
According to the prediction which was taken place there is no a significant change is predicted.						
Kunduz	0	0	0	0	Fit to normal.	No change Is seen.
Aibak	0	0	0	0	Fit to normal	No significant Change.
Dara-e-soof	2	0	0	0	Normal	No change
Jawzjan	0	0	0.2	0.2	Normal	No change
Mazar	0	0	0	0	Normal Fit.	No change is seen.
Saripul	0	0	0	0	normal	Not significant Change.
Kandahar	0	0	0	0	Normal Fit.	No change
Lashkerga	0	0	0	0	Normal Fit.	No change
Uruzgan	0	0	0	0	Normal	No significant Change.
Zaranj	0	0	0	0	Normal Fit.	No change
Gardiz	16.8	41.5	1.2	-40.3	Over normal	Wettest
Ghazni	15	16.7	0.2	-16.5	Over normal .	Wettest
Khost	28	23.6	32.7	9.1	Under normal.	To dryness..
Sardi	0	40	2.3	-37.7	Over normal	Wettest
urgun	67	16	2.4	-13.6	Over normal	No change .
Farah	0	0	0.1	0.1	Under normal	No change .
Hirat	0	0	0	0	No change .	No change .
Qalaw-e-naw.	0	0	0	0	No change .	No change.
shindand	0	0	0	0	No change .	No change.

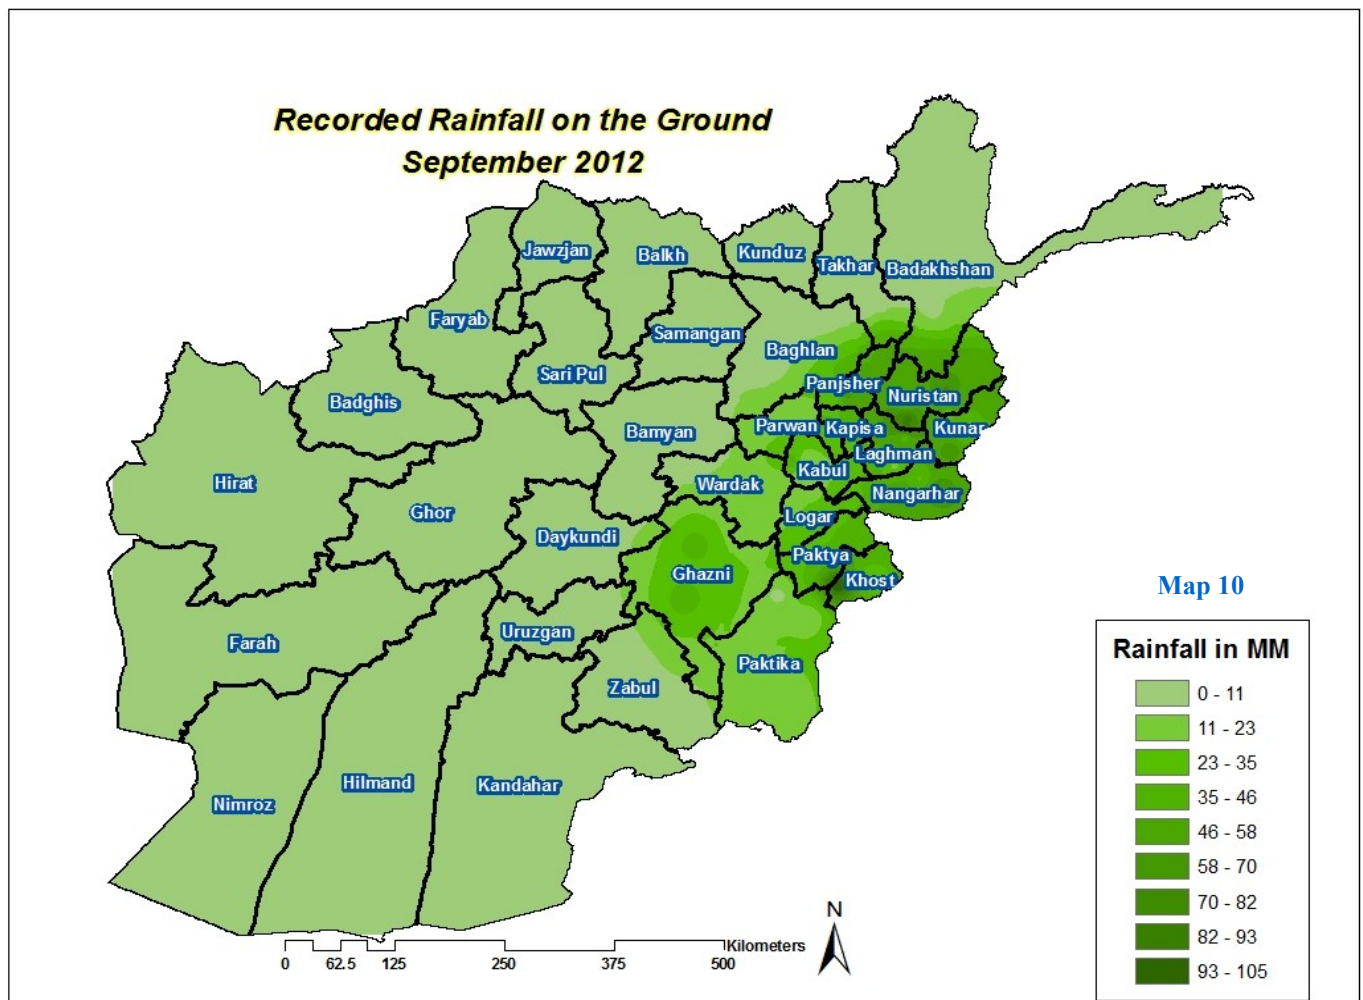

Precipitation

Due to the climate change and synoptic situations changes, rainfall situation has been changed. However the Eastern and Southeastern regions of the country received good rainfall due to Indian Monsoon activities but still Comparison of rainfall data for the month of September 2012 with the same month in 2011 (Chart 1) shows a decrease of rainfall during the month of September 2012 over the same month of last year all over the country.

Comparison of rainfall data for the month of September 2012 with the same month of long term

average (Chart 1) shows significant increase of rainfall during the month of September 2012 over the same month of long term average.

Most amount of rainfall has been occurred in the Eastern region and Southeastern regions but some parts of the Capital region has received moderate rainfall during the month of September 2012, in the rest of the country seasonal dryness has continued.

Rainfall Graphs for the Month of September 2012

Rainy Days

Importance of rainy days for crop growth is significant, that is because, however the rainy-days are many more, to that extend the soil-moisture would be sufficient for crop's feeding, according to the table .

According to the aforementioned tabulated data, there are significant values indicating the aridity in some provinces. particular in the months of June –July –August and September 2012.

No	Station Name	September of 2012		Table 2 Comparison Prediction
		Rainy Days		
		2011	2012	
1	Paroon	15	3	Dry
3	Kabul	2	0	Dryness
4	Mehterlam	5	0	Dryness
5	Paghman	3	2	No change
6	Ghazi abad	3	0	Dryness
7	Logar	2	0	Dry
8	Khost	7	7	No change.
9	Gardiz	4	0	Dryness
10	Asmar	2	5	No Dry
11	Sarobi	1	2	No change.
12	Ghazni	1	1	No change and dry
13	Jalalabad	2	0	No change and dry
14	Aibak	0	0	No change and dry
15	Mazar	0	0	No change and dry
16	Sari pul	0	0	No change and dry
17	Faiz abad	0	0	No change and dry
18	Dara-e-soof	0	0	No change and dry
19	Uruzgan	0	0	No change and dry
20	Baghlan	0	0	No change and dry
21	Kunduz	0	0	Not dry
22	Talughan	0	0	No observation
23	Jawzjan	0	0	No change and dry
24	Bamyan	0	0	Not dry.
25	Kandahar	0	0	No change and dry
26	Lashkergha	0	0	No change and dry
28	Zaranj	0	0	No change and dry
29	Urgone	0	0	No change and dry
30	Farah	0	0	No change and dry
31	Hirat	0	0	No change and dry
32	Qala-e-naw	0	0	No change and dry
33	Shindand.	0	0	No change and dry

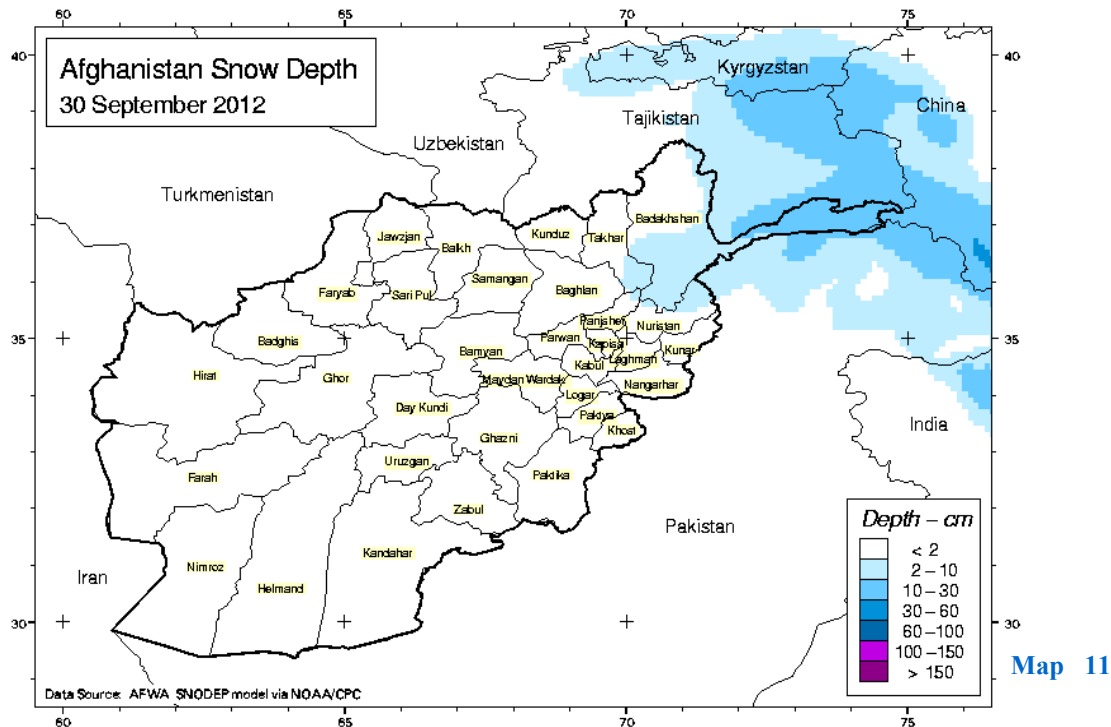

Rainy Days for the Month of September 2012

Comparison of rainy days for the month of September 2012 with the same month of last year (Chart 2) shows

That rainy days had small decrease during the month of September 2012 over the same month of last year.

Afghanistan Snow Depth for month of September 2012

Due to the climate changes, there is not that much snow on the higher elevations of the country, Northwest and western systems and the high elevations of the Capital region unusually experienced light snow.

Map (11) shows snow depth for the end of September 2012. As map (11) shows the snow depth has been recorded from 10 to 30 cm in the extreme border in Northeastern.

Thermal regime of observational regions in Afghanistan:

Thermal regime in different regions of Afghanistan is following up to the temperature observations, that is because there is no homogenous distribution of temperature in all over the country, later on we will be the witness of different data from different observational stations. If you consider the following table of temperature, it is obviously that different thermal area could be seen. According to the following table of observation.

Table of (Variations of Max-Min and actual temp with respect to average of 2011). Since there are no much differences among the Deviations of max-temperature with respect to average 2011, and Deviations of Min-temperature with respect to average 2011, and also the Deviations of actual temperature from average of 2011, so there cannot be seen any high anomalies in the path of variations of temperature among the observational stations in the country.

According to the terms of crop's thermo periodism can be said that, there is a direct and linear relationship between crop growth and its temperature needs, so the assumption was that the growth of plants is dependent on the total amount of heat to which it is subjected during its life time. The heat unit or growing degree days are defined as follows.

$$GDD = [(T_{max} + T_{min})/2] - T_t$$

Where T_{max} is the maximum temperature in Celsius degrees, and T_{min} is the minimum temperature in Celsius degrees, and T_t is minimum threshold or base temperature.

The minimum threshold temperature is the temperature below which no growth takes place, namely it varies from 4.5 to 12.5 degrees Celsius for different crops also

Station	Max-tem-Celsius degree 2012	Average 2011	Deviation	Min-Tem-Celsius degree. 2012	Average 2011	Deviation	Actual 2012	Average 2011	Table 3 Deviation
Zarang	45	35.2	9.8	24.2	35.2	1.0	34.3	35.2	0.9
Jalalabad	44.0	32.6	11.6	24	32.6	-8.6	34	32.6	1.4
Mazar	43.0	32.3	10.7	21.4	32.3	10.9	32.2	32.3	0.1
Shiberghan	42.5	31.6	10.9	20.3	31.6	11.3	31.1	31.6	0.5
Kunduz	42.4	32.2	10.2	20.8	32.2	11.2	31.5	32.2	0.7
Kandahar	41.7	32.6	9.1	19.8	32.6	2.8	30.8	32.6	1.8
Laghman	40.4	30.9	9.5	21.6	30.9	9.3	33.9	30.9	3.0
Hirat	39.8	29.2	10.6	19	29.2	10.2	29.3	29.2	0.1
kabul	37.6	25.5	12.1	12.4	25.5	13.1	25.3	25.5	0.2
Logar	37	24.3	12.7	10	24.3	14.3	23.5	24.3	0.8
ghazni	34	23.6	10.4	12.7	23.6	10.9	23.4	23.6	0.2

In most parts of the country temperature had no significant change during the month of September 2012 over the same month in , but lowlands particularly the Southwestern region had experienced higher temperature comparison to the same month of last year.

month of September 2012 with the same month in 2011 (Chart 3) shows that, there is no significant change in temperature during the month of September 2012 compared to the same month of last year around the country.

Comparison of monthly average of temperature for the

Temperature for the Month of September 2012

Zaranj with 40.4 °C was the warmest spot of the country during the month of September 2012

Chart (4) shows maximum and minimum temperature for the month of September 2012. As chart shows Zaranj with 40.4 °C was the warmest spot of the

country, and Bamyan with 2.4 °C experienced the lowest temperature.
